Microsoft

GitHub Copilot Jumpstart

Our scenario

Hi Ahmed,

Welcome to Zava. We are happy to have you on the team.

Ahmed, to help you get started, please begin by reviewing the open issues in our GitHub repository at https://github.com/ahmedsza/aitourdemo/issues .

There's quite a bit to tackle — especially around improving **testing**, enhancing **code quality**, and sorting through some incomplete work left by the previous developer. Feel free to review what's there, continue where it makes sense, or refactor where needed. Your fresh perspective will be valuable.

We also recommend using the **GitHub Copilot** as part of your daily workflow. It will help you:

- Understand the existing codebase faster
- Improve test coverage and overall code quality
- Automate repetitive development tasks
- Navigate and refactor the repository more efficiently

Immediate action
The Microsoft okes tell that there is something called the GitHub Coding Agent that is almost like a 'virtual developer' – and apparently you can assign issues to it. You might want to start here
Regarding the **testing and Gherkin-related issue**, **Gladys West** will be sending you a set of instructions and guidelines to get started on this.

If you need help with repository access, setting up tools, or understanding our engineering practices, the team is here to support you.
Welcome aboard, Ahmed — we have lots to build together!

Best regards,

Microsoft

Demo – Hello Agent

GitHub Copilot is an AI assistant used across the SDLC by various personas to turn context (code, docs, tickets, logs) into artefacts that speed up delivery and improve quality.

I'm powered by AI, so surprises and mistakes are possible. Make sure to verify any generated code or suggestions, and share feedback so that we can learn and improve

Available in various IDE's and places – with different plans

Agent=Models+ Tools + Instructions

The Agent Loop

How did we do

Checklist	
Working Scenario	Maybe
Reviewed code	No
Tests	Maybe
Exception Handling	Maybe?
Monitoring/Telemetry	Maybe
Adhering to Standards/ Correct frameworks	Maybe?
Met Functional Requirements	Maybe
Secure	Maybe?
Scale and Performance..	Maybe?
Readable and maintainable	Maybe?
Documentation	Maybe?
CI/CD	No

But… Coding is now cheaper… You can implement and throw away code especially for prototype and POC..

Prompt and Context Engineering

- Prompt Engineering
  - Process of designing and creating high quality prompts
  - Used to generate useful and accurate results
  - Different techniques (zero shot, few shot, persona, think step by step etc.)

  - Context
  - Clarity
  - Intent
  - Specificity

Telling agent what to do..

- Context Engineering
  - Providing the right information to the LLM to get a more reliable result
  - Broader than prompt engineering
  - build a context pipeline that decides what to include, in what format, in what order, and how to keep it accurate and bounded.

- Toolbox – Custom Agents, Prompts, Instructions, Skills, MCPs, hooks, plugins

- Take heed of the context window

Providing agent with all relevant information

How can we improve..

Craft good prompts

- Prompt Engineering

Review the generated code. You are responsible

Understand your “environment” before jumping in – understand code and more

- Context engineering

Plan before implement. Break down into smaller tasks

- Context engineering

Guide the AI Agent – guardrails, instructions, customizations

- Context Engineering
- AI Engineering or AI SDLC

DevOps practices matter even more

https://devblogs.microsoft.com/all-things-azure/agentic-devops-practices-principles-strategic-direction/

There is an uncomfortable truth that most teams are not ready to hear: agents do not magically fix broken engineering practices. They scale them. If your CI/CD pipelines are fragile, agents will break them faster. If your test coverage is thin, agents will ship untested code at higher velocity. If your infrastructure is manually configured, agents will produce deployments that drift from reality.

Before any team considers adopting agentic workflows at scale, they need to audit their DevOps foundations.

Dimension	Minimum Threshold for Agentic Readiness	Risk if Missing
CI/CD Pipelines	Fully automated build, test, and deployment with consistent execution across environments	Agents produce code that passes locally but fails in production; no reliable feedback loop
Automated Testing	Unit, integration, and end-to-end tests that run on every pull request with meaningful coverage thresholds	Agent-generated code ships without behavioral validation; hallucinated logic reaches production
Infrastructure as Code	All environments provisioned through version-controlled templates with drift detection	Agent-proposed infrastructure changes have no validation pathway; manual environments become inconsistent
Security Scanning	Dependency scanning, secret detection, and code analysis integrated into every pipeline run	Agents introduce vulnerable dependencies or leak secrets without detection
Branch Protection	Required reviews, status checks, and merge restrictions enforced at the repository level	Agent-authored code merges without human oversight; trust boundaries collapse
Observability	Logging, monitoring, and alerting in production with clear ownership and escalation paths	Agent-introduced regressions go undetected; mean time to recovery increases

Teams, roles, and workflows

State and actions of the business

Curated knowledge

SDLC Phases

Plan

- Structured requirements derivation from High-Level Specs
- User Story Generation

Design

- Create the design artifacts: solution design, Architecture diagrams.
- Review architecture and system diagrams for quick approval

Develop

- Infra Setup Aligned to Design
- Database Scripts Ready to deploy
- Application Development from Scratch

Test

- Backlog-Driven Functional Test Design
- Functional Test Automation Script Generation

Release

- Automating Release Pipelines (CI/CD)

Maintain

- Understand unfamiliar codebases
- Fix bugs & Code Review

Output

- Detailed Requirement Document
- Well-Defined Backlog Item
- Solution design artifacts
- Review-ready Architecture & system diagrams
- Infrastructure set up per design.
- App built to specs from scratch to the agreed design and wireframes.
- Functional Test Cases
- Automated Test Script generation
- Script for Deployment

Microsoft

Research, Plan, Implement, and more..

Agent Driven Development Process

- Think about your current way of working
  - Team with different roles
  - processes with a workflow
  - tools to support the processes.
- Create your own “workflows”
  - build vs “buy” vs customize
- Microsoft (open source)
  - https://github.com/microsoft/devsquad-copilot
  - https://github.com/bradygaster/squad
  - https://github.com/github/spec-kit
  - https://github.com/microsoft/hve-core
- Others -- Review them fully. Provided purely for informational purposes
  - https://github.com/obra/superpowers
  - https://github.com/steveyegge/beads
  - https://github.com/MrLesk/Backlog.md
  - ShepAlderson/copilot-orchestra
  - bigguy345/Github-Copilot-Atlas

  - https://github.com/gsd-build/get-shit-done
  - https://docs.bmad-method.org/

AI “engineering”

- https://danielmeppiel.github.io/agentic-sdlc-handbook/
- https://danielmeppiel.github.io/awesome-ai-native/
- Beyond vibe coding: The five building blocks of AI-native engineering | Thoughtworks India

Constraint	Principle	Induced Property
Progressive Disclosure	Structure information to reveal complexity progressively	Efficient context utilization
Reduced Scope	Match task size to context capacity	Manageable complexity
Orchestrated Composition	Simple things compose; complex things collapse	Flexibility, reusability
Safety Boundaries	Autonomy within guardrails	Reliability, security, verifiability
Explicit Hierarchy	Specificity increases as scope narrows	Modularity, inheritance

Different workflows based on the scenario

Customizations- the foundations of building workflows

Goal	Use	When it activates
Apply coding standards everywhere	Always-on instructions	Automatically included in every request
Different rules for different file types	File-based instructions	When files match a pattern or description
Reusable task I run repeatedly	Prompt files	When you invoke a slash command
Package multi-step workflow with scripts	Agent skills	When the task matches the skill description
Specialized AI persona with tool restrictions	Custom agents	When you select it or another agent delegates to it
Connect to external APIs or databases	MCP	When the task matches a tool description
Automate tasks at agent lifecycle points	Hooks	When the agent reaches a matching lifecycle event

Examples

Need	Use	Why
Core codebase rules	**Always-on Instructions**	Lean, every session
Rules for /tests folder	**File-based Instructions**	applyTo is deterministic
Run and fix tests quickly	**Prompt**	One-shot, user-invoked
Parse PowerPoint files	**Skill**	Capability + scripts
Constrained workflow	**Custom Agent**	Tools + system prompt enforced
Planning with review	**Top-level Agent**	Orchestrates the work
Isolated context-heavy task	**Subagent**	Returns result only
External API with auth	**MCP**	Security boundary

Practices

https://code.visualstudio.com/docs/copilot/best-practices

1. Optimize your project for AI
2. Pick the right tool for the task
3. Write effective prompts
4. Provide the right context
5. Choose the right model
6. Plan first, then implement
7. Review and verify AI output
8. Manage context and sessions

https://code.visualstudio.com/docs/copilot/guides/prompt-engineering-guide
https://code.visualstudio.com/docs/copilot/guides/context-engineering-guide

Maximize GitHub Copilot's Potential

1. Code Completion
2. Code Refactoring & Optimization
3. Documentation & Comment Generation
4. Test Generation
5. Bug Fixing & Debugging Assistance
6. Code Conversion
7. Infrastructure as Code & Automation
8. Copilot in the CLI
9. SQL Query Optimization
10. Learning & Skill Development

++ more..

Adopting Copilot

- **Will share on https://github.com/ahmedsza/ghcpjumpstart**
- Keep Learning, adapting – YouTube videos
- Microsoft Learn – search for “github copilot”
  - https://learn.microsoft.com/en-za/training/browse/?terms=github%20copilot
- Github Skills
  - https://learn.github.com/skills
- Culture, Culture, Culture
- Change Management
  - https://github.com/github/ai-adoption-playbook

We've learned that **AI adoption is fundamentally a people problem, not a technology problem.** Success isn't about buying the right tools—it's about building the human infrastructure that turns hesitant employees into confident power users.

Summary

1. Agent=Model + Tools + Instructions
2. Craft good prompts – Prompt Engineering
3. Context is critical -> Context Engineering
4. You are responsible for reviewing the output - always review and own the code
5. Plan and Break down the work
6. Copilot is available in many places – integrated into your existing tools and workflows – VS Code, Visual Studio, JetBrains, Eclipse, Xcode, Web, CLI, etc
7. Skills, MCP, agents, instructions and customization capabilities create possibilities
8. It is for “everyone” – not just developers
9. It is a collaboration tool that improves over time. Keep learning and adapting
10. From
    - chat → workflow
    - “AI that writes code” → “AI that understands your environment and can act safely”.
11. It is not a replacement for a human
12. You need to design your workflow
13. DevOps practices matter even more

extras

Types of Agents

Creating Copilot Spaces

Who can create	Anyone with a Copilot license
Owned by	Organizations or individual users
Content type	Any code, pull requests, or issues hosted in repositories and free-text content
Context handling	Limited in size, which guarantees higher response quality given the focused selection

Instructions

Include areas of expertise, what kinds of tasks it should help with, and what it should avoid to keep responses relevant

Adding context

Add text, code files, or GitHub data to set a permanent context. This will be used to provide more relevant answers.

Code Completions

Code completions

- Start typing in the editor, and Copilot provides code suggestions
- match your coding style and take your existing code into account.
- Can show alternative suggestions and accept partial suggestions
- Can show in a new tab
- Can be disabled.

Next edit suggestions

- Predict your next code edit with Copilot next edit suggestions, aka Copilot NES.
- Based on the edits you're making, NES both predicts the location of the next edit you'll want to make and what that edit should be.
- Use cases - simple mistakes like typos, challenging mistakes in logic, Changing intent, Refactoring

Smart Actions

- For several common scenarios, you can use *smart actions* to get help from AI without having to write a prompt.
  - Examples of these smart actions are generating commit messages, generating documentation, explaining or fixing code, or performing a code review.

- Scenarios
  - *Generate a commit message and PR information*
  - *Implement todo comments*
  - *Rename symbols*
  - *Generate alt text for images in Markdown*
  - *Generate documentation*
  - *Generate tests*
  - *Explain code*
  - *Fix coding errors*
  - *Fix testing errors*
  - *Fix terminal errors*
  - *Review code*
  - *Semantic search results (Preview)*
  - *Search settings with AI*

GitHub Copilot app modernization

Modernize your apps in days, not months!

Accelerate Java and .NET upgrades
Upgrade language runtime versions and frameworks effortlessly with AI-driven remediation and automated error fixes—no more dependency headaches.

Streamline end-to-end migration
From assessment to deployment, simplify the migration journey with full visibility, control, and predictability, while delivering higher quality outcomes.

Become Cloud and AI ready
Make apps cloud-ready by resolving compatibility issues, reducing technical debt, and strengthening security while unlocking the full power of Azure services.

Included in GitHub Copilot License

Available in VS Code, Visual Studio

Key Capabilities	Description
Assessment & Planning	Code assessment made easy. GitHub Copilot reviews your .NET and Java codebase to generate modernization plans, helping you prioritize efforts.
Code Transformations	Automated transformation. Copilot combines expert-led Azure migration strategies with automated upgrades, applying high-confidence changes with precision.
Patching CVE and security checks	Security is built-in. GitHub Copilot scans for known CVEs and flags outdated dependencies. In agent mode, it can auto-fix issues—letting you review and approve changes.
Build, Validate and Tests	Test coverage enhanced. Existing test cases are migrated, and new ones are generated automatically—ensuring consistency and compliance.
Containerization	Effortless containerization. Copilot auto-generates Docker files to help you containerize your app with minimal effort.
Deployment	Deployment-ready artifacts. Copilot generates deployment files and supporting assets to accelerate dev/test setup and build confidence for production.

Get Started

Spec Kit https://github.com/github/spec-kit

Spec Driven Development

- flips the script on traditional software development.
- specifications become executable
- directly generating working implementations rather than just guiding them.
- Intent-driven development where specifications define the "what" before the "how"
- Rich specification creation using guardrails and organizational principles
- Multi-step refinement rather than one-shot code generation from prompts
- Heavy reliance on advanced AI model capabilities for specification interpretation

Command	Description
`/constitution`	Create or update project governing principles and development guidelines
`/specify`	Define what you want to build (requirements and user stories)
`/clarify`	Clarify underspecified areas (must be run before `/plan` unless explicitly skipped; formerly `/quizme`)
`/plan`	Create technical implementation plans with your chosen tech stack
`/tasks`	Generate actionable task lists for implementation
`/analyze`	Cross-artifact consistency & coverage analysis (run after /tasks, before /implement)
`/implement`	Execute all tasks to build the feature according to the plan
